

Senior Project Architect 10+ Years Technical Focus

VPS ARCHITECTURE is seeking a senior-level Project Architect with 10 or more years of experience who understands how buildings come together from design intent through construction.

The primary role of this position is to provide technical expertise and support to the project delivery team, with a focus on detailing, construction documentation, code compliance, and overall constructability. This role is rooted in developing high-quality technical documents and applying building systems knowledge to ensure design intent is executed with precision and performance.

This position is for someone who is technically grounded, detail-driven, and able to think holistically about how architecture functions as a complete system. You are comfortable coordinating complex building elements, resolving technical challenges, and translating design concepts into clear, well-executed construction documents. You also enjoy being a resource to others, mentoring and helping strengthen technical skills across the studio.

You bring:

10 or more years of professional architectural experience

Strong technical expertise in building systems, detailing, and constructability

Extensive experience producing and coordinating construction documentation

Working knowledge of codes, standards, and regulatory requirements

A hands-on, problem-solving mindset and the ability to lead the production side of project delivery through quality assurance reviews and consultant coordination

If you take pride in making architecture work technically, thoughtfully, and completely, we would love to connect.
